The application has been amended as follows:

Claim 30 line 10 "signalling" has been changed to --signaling--.

Claim 55 line 2 "signalling" has been changed to --signaling--.

Claim 47 line 12 "signalling" has been changed to --signaling--.

Claim 64 line 8 "signalling" has been changed to --signaling--.

Claim 69 line 3 "signalling" has been changed to --signaling--.

Claim 74 line 12 "signalling" has been changed to --signaling--.

***Allowable Subject Matter***

1. Claims 30, 32-34, 36-47, 49-51, 53-64 and 66-74 are allowed.

***Reason for Allowance***

2. The following is an examiner's statement of reasons for allowance:

The prior art of record does not teach the following:

In regards to claim 30 the prior art does not teach a second data network connected to the plurality of VPNs via the first data network, the second data network using a network addressing scheme that is different to a network addressing scheme used by at least one of plurality of VPNs; a VPN gateway interfacing the first data

network and a call server in the second data network, the VPN gateway being configured to pass communication session signaling traffic between an entity in one of plurality of VPNs and the call server for establishing a communication session between entity in one of plurality of VPNs and an entity in an external Time Division Multiplex 'TDM' network, external TDM network handling communication session bearer traffic in a TDM format different to a packet data format of the first data network; and a VPN converter interfacing the first and second data networks and directly interfacing the first data network to external TDM network, the VPN converter being configured to receive bearer traffic relating to communication session established between entity in one of plurality of VPNs and the entity in the external TDM network and to convert bearer traffic between the packet data format of the first data network and the TDM format used in the external TDM network.

In regards to claim 47 the prior art does not teach second data network using a network addressing scheme that is different to a network addressing scheme used by at least one of plurality of VPNs; a VPN gateway interfacing the first data network and a call server in the second data network; and a VPN converter interfacing the first and second data networks; the method comprising the steps of: directly interfacing the first data network to an external Time Division Multiplex 'TDM' network; configuring the VPN gateway to pass communication session signaling traffic between an entity in one of plurality of VPNs and the call server for establishing a communication session between entity in one of plurality of VPNs and an entity in external TDM network, external TDM network handling communication session bearer traffic in a TDM format

different to at a packet data format of the first data network; and configuring the VPN converter to receive bearer traffic relating to communication session established between entity in one of plurality of VPNs and the entity in the external TDM network and to convert bearer traffic between a the packet data format of the first data network and the TDM format used in the external TDM network.

In regards to claim 64 the prior art does not teach second data network using a network addressing scheme that is different to a network addressing scheme used by at least one of plurality of VPNs; and a VPN gateway interfacing the first data network and a call server in the second data network, the VPN gateway being configured to pass communication session signaling traffic between an entity in one of plurality of VPNs and the call server for establishing a communication session between entity in one of plurality of VPNs and an entity in an external Time Division Multiplex 'TDM' network, external TDM network handling communication session bearer traffic in a TDM format different to a packet data format of the first data network; the VPN converter comprising: interfaces for interfacing the first and second data networks and directly interfacing the first data network to external TDM network, means for receiving bearer traffic relating to communication session established between entity in one of plurality of VPNs and the entity in the external TDM network; and means for converting bearer traffic between a the packet data format of the first data network and the TDM format used in the external TDM network.

In regards to claim 74 the prior art does not teach the second data network using a network addressing scheme that is different to a network addressing scheme used by at least one of plurality of VPNs; a VPN gateway interfacing the first data network and a call server in the second data network; and a VPN converter interfacing the first and second data networks and directly interfacing the first data network to an external Time Division Multiplex 'TDM' network; the steps of: causing the VPN gateway to pass communication session signaling traffic between an entity in one of plurality of VPNs and the call server for establishing a communication session between entity in one of plurality of VPNs and an entity in external TDM network, external TDM network handling communication session bearer traffic in a TDM format different to a packet data format of the first data network; and causing the VPN converter to receive bearer traffic relating to communication session established between entity in one of plurality of VPNs and the entity in the external TDM network and to convert bearer traffic between the packet data format of the first data network and the TDM format used in the external TDM network.

The prior art alone or in combination fails to jointly suggest or teach the claimed combination of features as taught by the instant application. Therefore claims 30, 32-34, 36-47, 49-51, 53-64 and 66-74 are to be deemed allowable over prior art.
